

Handte Em Profi - Emulsion Mist Separator

- Self Cleaning - Oil particles and drops of fluid clump to each other on the inlet side making them easier to separate. This causes the separated cooling lubricant to automatically rinse the first filter stage clean.
- Fully automatic sprayer preventing the filter from drying out and cleans the filter, improving separation performance
- Equipped with a second demister stage, through which only clean gas flows. Preventing oil from penetrating into the clean air and functions as a firewall as well.
- Extremely easy maintenance mean the filters almost never need to be changed.

Handte Oil Expert - Oil Mist

- The standard two stage filtration CoaPack filter elements provide high separation efficiencies
- The compact modular design provides for easy, efficient adaptation for the customer's individual requirements.
- The particle structure of the filter material combines premium separation performance with self-cleaning features via optimum drainage of the separated cooling lubricant, ensuring extremely long filter life.
- The operation is practically maintenance free. Filter changes are clean and easy and require no tools. The closed filter elements can be removed without being exposed to the oil-soiled filter materials
